A)
Application layer: Graphical access (http://databank.nmrlipids.fi/), results from analyses
Databank layer: Programmatic access to the raw data (README.yaml files), experimental data, basic analyses and quality evaluation
Data layer: Raw simulation data in publicly available repositories

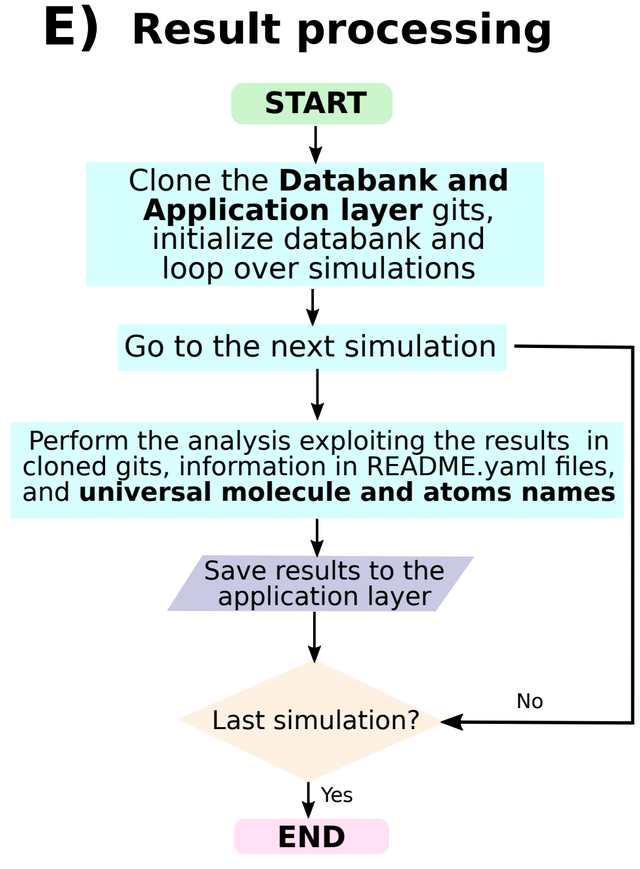
D) Property analysis
START
Clone the Databank layer git, initialize databank and loop over simulations
Go to the next simulation
Interesting simulation for the analysis?
No
Yes
Download data
Perform the analysis exploiting universal molecule and atoms names
Save results to the application layer
Last simulation?
No
Yes
END



E) Result processing
START
Clone the Databank and Application layer gits, initialize databank and loop over simulations
Go to the next simulation
Perform the analysis exploiting the results in cloned gits, information in README.yaml files, and universal molecule and atoms names
Save results to the application layer
Last simulation?
No
Yes
END
